

Appendix B

World exports by source, destination and commodity group

This appendix presents the historical data on world trade from 1961 to 1979 on which much of the analysis in this Review is based. The primary sources of these data are United Nations Yearbooks of International Trade Statistics supplemented by recent issues of the United Nations Monthly Bulletin of Statistics and, for 1979, a variety of other publications.

The tables provide estimates of the value of exports (in billion US dollars) by source, destination and commodity group. The geographical classification follows that used by the United Nations (see p.11 for exact definitions). The commodity classification follows sections of the SITC.

The preparation of the tables presented three main problems.

First, little information was available on commodity breakdowns in 1979 so that many of the entries for this year had to be estimated by interpolation.

Second, data series published by the United Nations are not continuous, and therefore had to be linked at several points.

Finally, and most serious, the United Nations

data do not in general sum over sources, destinations or commodity groups owing to incomplete reporting of trade flows by individual countries. The main discrepancies arise because destinations of exports are not always known or indeed in some cases may be deliberately kept secret. All such discrepancies have been eliminated from our tables by an iterative adjustment process based on *a priori* judgements of the probability of under-reporting of exports to different destinations. The estimates here should therefore sum correctly with a full imputation of the destination of all exports.

Once such a reconciliation has been performed, the sum of exports to each area can be regarded as a measure of the area's imports. It should be noted that imports measured in this way differ from those recorded in national trade accounts, not only because they are here valued f.o.b., but also because they are allocated between years on the basis of the date of shipment rather than arrival. The advantage for our purposes is that when imports are measured in this way there is a precise identity between trade as viewed by exporting and importing countries.

World exports by source, destination and commodity group

1961
